Provided is a [[A]]composition for oral administration which achieves release of a drug  
release in two spikes and which comprises. The compositions may comprise a single population  
of uncoated particles, wherein the particles consist of a homogenous mixture which comprises  
the drug consisting essentially of a water-soluble drug and an enteric polymer. The ratio of the  
enteric polymer to the water-soluble drug in the single population may be greater than 4 and less  
than 100.
